

TASK 7 — DIGITAL STUDENT PROFILE

Ayush Passport: Essential Data for a Verified BAMS Student Profile

Research Report | Team Leader Submission

Research Question: In a verified BAMS student profile, which information is most impactful—College NOC, Clinical Hours, Certifications, or other academic/clinical credentials?

1. Executive Summary

The proposed Ayush Passport should function as a **verified academic and clinical profile**, not merely as a digital student ID. For BAMS students, it should combine institutional identity, academic status, clinical postings, verified clinical exposure, internship, certifications, competencies and verification metadata.

NCISM's assessment framework explicitly considers clinical exposure, department-wise clinical posting duration against prescribed hours/weeks, and internship opportunities. NCISM internship guidance also requires an e-logbook containing day-to-day records that are verified/certified by the relevant authority. This makes verified clinical exposure a particularly strong indicator for a digital profile. ■cite■turn0search24■turn0search26■turn0search27■

Key recommendation: Make **verified clinical hours/clinical training and internship** the most visible evidence of practical exposure; use **college/university verification or NOC** as the authenticity layer; and use **certifications** as supporting evidence of additional skills.

2. Research Evidence

NCISM states that BAMS students undergo mandatory clinical experiences in varied settings, including teaching hospitals and community health centres. Its assessment framework also identifies department-wise clinical posting duration against prescribed hours or weeks and clinical posting rotation schedules as supporting evidence. ■cite■turn0search24■

NCISM's internship orientation material describes internship as a transition from academic learning to hands-on clinical practice and highlights clinical competencies, communication, professional skills, mandatory attendance and e-logbook maintenance. ■cite■turn0search27■

NCISM internship guidance states that interns maintain day-to-day electronic records of procedures done, assisted or observed, with verification/certification by the Medical Officer, Head of Unit or Department. This provides a strong model for digitally verified clinical records. ■cite■turn0search26■

The Ministry of Ayush publishes official BAMS education information and current central-nomination guidance, supporting the use of recognized academic and institutional records in an Ayush-focused student profile.

3. Recommended Data Fields

Category	Recommended data	Priority	Purpose
Identity	Name; student/enrolment ID; profile status	High	Identifies the student and links records.
Education	BAMS; college; university; professional year; academic status	Very High	Establishes formal academic background.
Institutional Verification	College/university; verification status; date; reference ID; NOC where applicable	Very High	Provides authenticity.
Clinical Hours	Verified hours; dates; department/rotation; institution	Very High	Measures practical exposure.
Clinical Training	Departments; setting; activities/competencies; supervisor	Very High	Shows practical training context.
Internship	Institution; dates; rotations; completion; e-logbook status	Very High	Shows structured supervised experience.
Certifications	Title; issuer; date; validity; verification status	High	Shows additional training.
Skills/Competencies	Relevant verified competencies; source of verification	High	Supports opportunity matching.
Research/Achievements	Projects; presentations; publications; workshops	Medium	Shows academic engagement.

Category	Recommended data	Priority	Purpose
Verification Metadata	Verifier; verification date; document/reference ID	Very High	Makes records traceable.

4. Impact Comparison: NOC vs Clinical Hours vs Certifications

Data	What it proves	Impact	Recommended role
Verified Clinical Hours	Amount of practical exposure	★★★★★	Core indicator
Clinical Training / Internship	Context, rotations and supervised learning	★★★★★	Core indicator
College / University Verification / NOC	Institutional authenticity	★★★★■	Essential trust layer
Certifications	Additional learning and skills	★★★★■	Supporting evidence

5. Key Finding

Most impactful: verified clinical exposure—clinical hours plus clinical training—is the strongest indicator of practical experience. A certificate can show completion of an additional course, while verified clinical records show structured exposure in a real training setting. NCISM specifically evaluates clinical posting duration and internship-related clinical opportunities.

■cite■turn0search24■turn0search27■

NOC/college verification remains essential, but its purpose is different: it validates the authenticity of the student's institutional association and records. Therefore, the Passport should use NOC/verification as the **trust layer** and clinical records as the **experience layer**.

6. Proposed Ayush Passport Structure

1. **Verified Profile Header:** Student name, BAMS, institution and verification status.
2. **Academic Record:** College/university, professional year, enrolment and academic status.
3. **Clinical Exposure Dashboard:** Verified clinical hours, departments, rotations, dates and institutions.
4. **Internship Record:** Institution, dates, rotations, completion and verified e-logbook status.
5. **Certifications:** Certificate name, issuer, date and verification status.
6. **Skills & Competencies:** Competencies supported by a defined verification source.
7. **Research & Achievements:** Projects, presentations, publications and workshops.
8. **Verification History:** Verifier, verification date and document/reference ID.

7. Data Quality & Privacy Recommendations

- Label information as **Verified**, **Pending Verification** or **Self-Declared**.
- Prefer institution-issued or institution-verified records for clinical hours, internship and academic credentials.
- Link clinical records to department, dates and supervising authority where appropriate.
- Maintain an audit trail showing when and by whom a record was verified.
- Display only information necessary for academic and professional verification.

8. Final Recommendation

The Ayush Passport should be positioned as a **Verified BAMS Student Competency Profile**. Its highest-value information should be **verified clinical hours, clinical training and internship**, supported by institutional verification. Certifications should strengthen the profile but should not replace core academic and clinical evidence. This approach reflects NCISM's emphasis on clinical postings, prescribed clinical exposure, internship and verified e-logbook records. ■cite■turn0search24■turn0search26■turn0search27■

9. Short Conclusion for Team Leader

“Our research suggests that the Ayush Passport should go beyond basic student details and become a verified academic and clinical profile. For BAMS students, verified clinical hours and clinical training are the most useful indicators of practical exposure. College/university verification or NOC should provide authenticity, while certifications should demonstrate additional skills. Therefore, the recommended core is: **Education + Institutional Verification + Clinical Hours + Clinical Training/Internship + Certifications + Verified Competencies.**”
